 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The sequence represents residues from a human immunoglobulin with homology to the heavy chain variable region from monoclonal antibody composed to the heavy chain variable region from monoclonal antibody 10x83 (AAR82990), specific for epidermal growth factor receptor, produced by a mouse hybridoma. The sequence is partial, and complementarity determining regions are omitted. The sequence is isolated by comparison of human and mouse immunoglobulins and analysis for T-lymphocyte antigenic sequences using a computer algorithm. Residues not within a complementarity determining region, canonical structure or Vernier zone may be modified to reduce immunogenicity in humans (e.g. in sequence AAR92992). This method, which involves the introduction of only a few point mutations into 7 reell epitope coding regions, is generally applicable in humanisation of mouse antibodies. The resulting humanised antibodies may be used of mouse antibodies. They retain the antipen recognition of the original antibody, but are not immunogenic in humans. Cupdated on 25-MAR-2003 to correct PI field.)

This invention describes a novel antibody that specifically binds mature human interleukin (II)-lbeta, and binds the same epitope on mature human II-lbeta as mouse monoclonal antibody Mu017 or humanized antibody Hu007. The antibody of the invention have antirheumatic, antiarthritic, antiatlargic, careborporcective, antiatlarmator, immunosuppressiv, antiallargic, careborporcective, antiatlargic, immunosuppressiv, antiallargic, acteborporcective, antiating them a vaccine. The antibody is useful for manufacturing a medicament for treating rhemmatoid archiritis or osteoarthritis, or for inhibiting cartilage destruction in a subject. The antibody is also useful for treating allergy, septic or endotoxic shock, septicaemia, stroke, asthma, gairf versus host disease, Crohn's disease, or inflammancy bowel disease. This sequence represents a protein associated with the humanised murine Mu007 antibody described in the disclosure of the

This is the amino acid sequence of the heavy chain variable region (VH) of humanised anti-alpha-v beta-3 vitronectin receptor monoclonal antibody DizHZHC 1-0. It is based on the VH sequence (see AAW84095) of human Kabat subgroup I VH, with complementarity determining regions (CDRs) from the murine anti-human alpha-v beta-3 vitronectin receptor monoclonal antibody DI2 (see AAW84033).

7 Murine framework residues (24, 48, 70, 72 and 74) are retained. The humanised heavy chain can be expressed in host are retained. The humanised heavy chain can be expressed in host cells using nucleic acid molecules (see AAW84098)). The humanised antibodies can be used for passive immunotherapy of disorders antibodies can be used for passive immunotherapy of disorders andiogenic related disorders, such as angiogenesis associated with diabetic retinopathy, atherosclerosis and restenosis, chronic with diabetic retinopathy, atherosclerosis and restenosis, chronic and cancer, e.g. solid tumour metastasis, and diseases where bone resorption is associated with pathology such as osteoporosis, opereolytic lesions produced by bone metastasis, bone loss due to immobilisation or sex hormone deficiency. They can also be used for targeted drug therapy, and for detection and diagnosis.

The present sequence represents the heavy chain variable region of the humanised murine antibody 3D1. The antibody has a binding specificity to 87 molecules. The antibody is used to construct humanized immunoglobulins, which comprise an antigen binding region of non-human origin and a portion of a human immunoglobulin. The humanized immunoglobulins are useful for treating autoimmune diseases, inflammatory diseases, inflammatory diseases, inflammatory diseases, inflammatory dermatitis, arthritis, inflammatory bowel disease, inflammatory dermatitis, and multiple sclerosis. The immunoglobulins are also useful for treating a transplant recipient or preventing transplant rejection in a transplant recipient, and treating proliferative disease (leukemia, lymphoma and cancer), anaemia (sickle-cell anaemia).

 This sequence represents the variable heavy (VH) chain of the humanised murine antibody HuMc3 VH. The Mc3 VH sequence was humanised using the buried residue modification technique, where important non-human framework residues are unaffected. The Mc3 antibody binds to the Antibody can titled of the human milk fat globule (HMFG). The milk fat globule membrane is derived from the apical surface of the mammalian epithelial edil during lactation, and therefore is a source for breast membrane glycoproteins. The antibody can be used in an in vitro method to detect a HMFG antigen (or antigen fragment), and to diagnose the presence of the antipon in a subject. The antibody can also be used to deliver an agent to a target (within a subjects body), containing a HMFG antigen. The antibodies can also be used for diagnosis, prognosis, and therapeutic high affinity hindian to the house of the hindian the high affinity hindian the h

 Hepatitis B virus (HBV) is responsible for hepatitis infection in humans, which may progress to liver cirrhosis or cancer. One of HBV's surface antigens is pre-S1. Monoclonal antibodies specific for pre-S1 antigen may efficiently neutralise HBV. The present invention relates to humanised antibodies specific for HBV surface antigen pre-S1. The humanised antibodies are useful for preventing HBV infection and for treating chronic hepatitis B. The Complementarity Determining Regions of mouse pre-S1 antibody KR127 were graffed onto human antibody to produce the humanised antibodies of the present invention. The present sequence is the humanised pre-S1 antibody HKR127HC(I) heavy chain variable region (VH). The coding sequence for the present sequence was produced from the coding sequence for the present sequence (AAA62115).

This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents capprosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-dabetic, anti-allergic, anti-arthritic, antivaral, immunosuppressive, thyromimetic, anti-arteriosclearctic, antidabetic, antiffertility, neuroprotective, antidabetic, antiffertility, neuroprotective, antidateriosclearctic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent capptosis by binding to cell surface Fas or inhibit it by competitive inhibit solutions. Hashimoto disease, rheumatoid arthritis, graft versus host disease, Slorgen's syndrome, pernicious or hypoplastic versus host disease, Slorgen's syndrome, pernicious or hypoplastic canemia, Addison's disease, rheumatoid arthritis, graft corent and allergy, allergy, arteriosclerosis, myocarditis, dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis (bulminat, chronic, viral (B, C or D) or alcoholic, and transplant rejection. (I) selectively induce it in abnormal cells They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic murine disease models. (I) act on the active site of Fas, i.e. they mimic cultive light on the induce liver disease, and have reduced in murine disease models. (I) act on the active site of Fas, i.e. they mimic murine disease, and have reduced in the method of the invention.

The sequences given in AAR29016-17 are portions of monoclonal antibodies which were encoded by plasmids contained within the mouse hybridoma, AUK12-20. The DNA encoding the complementarity determining regions (CDR's) was isolated by polymerase chain reaction. These antibodies recognise human interleukin-6 receptor (IL-6R). The hybridoma cells were transformed with plasmids containing fragments of the antibody gene which caused the production of the antibody from the hybridoma
 Human; antibody; interleukin-6; receptor; IL-6R; CDR; PCR; mouse; complementarity determining region; monoclonal; hybridoma; PCR; plasmid; polymerase chain reaction; amplify.
 Reconstituted human antibody to human interleukin-6 receptor has low antigenicity and contains mouse V-region complementarity determining regions

 Monoclonal antibody engineered to contain glycosylation site - in non-Fc constant heavy or light chain region, useful to diagnose or treat B cell malignancies, e.g. non-Hodgkins lymphoma
 The present sequence is the variable heavy chain of the B cell specific monoclonal antibody (MAD) hill: hill: is a highly specific anti-B cell lymphoma and anti-lymphocytic leukaemia cell humanised murine MAD. The MAD can be used to diagnose or treat B cell malignancies, e.g. non-Hodgkins lymphoma or chronic

 The anti-human HMI,24 antibody is the preferred cytotoxic antibody to be used in the treatment of lymphocytic tumours, including T-cell tumours and B-cell tumours better than mycloma. The antibody is preferably monoclonal and has ADCC or CDC type cytotoxicity. It may be chimeric or humanised, and preferably contains a human antibody constant region C gamma is to gamma 1. A preferred antibody is an anti-human HMI.24 antibody on an anti-human HMI.24 antibody or an entibody which binds to an epitope recognising anti-human HMI.24 antibody. The cytotoxic antibody is useful lymphocytic leukaemia, pre-B lymphocytic leukaemia, pre-B lymphoma, so acute or chronic B chronic T lymphocytic leukaemia.

human L and H chain C regions, and L and/or H chain V regions containing material originating in mouse anti-HM1.24 antibody. The V containing material originating in mouse anti-HM1.24 antibody. The V containing material originating in mouse anti-HM1.24 antibody. The V complimentarity determining regions of mouse origin and care the man is a reshaped humanised antibody. The C regions are human CK (L-chain) and human C gamma (especially C gamma i) (H-chain). The FR regions of the C contibody REI) and the FR regions of the H chain V region are derived from human subtype HSG1 (e.g. FR1-3 from human antibody HSG1 (e.g. FR1-3 from human antibody HG3 and FR4 from human antibody JH6). The present sequence represents an H chain V region from the present invention. The antibodies are used for the treatment of myeloma, especially by injection, intravenously, intramuscularly or subcutaneously. The antibodies are used for intramuscularly or subcutaneously. The humanised antibody has low antigenicity and is therefore effective therapeutically in humans.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

IG kappa chain - mouse
C;Species: Mus musculus (house mouse)
C;Date: 06-Jan-1995 #sequence_revision 06-Jan-1995 #text_change 21-Jan-2000
C;Accession: S42772
 A;Status: preliminary
A;Molecule type: mRNA
A;Residues: 1-217 <SCH>
A;Cross-references: EMBLX75536; NID:g414143; FIDN:CAA53226.1; PID:g414144
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin
F;14-93/Domain: immunoglobulin homology <IMM>

Antibody; salvage receptor binding epitope; Fab; F(ab')2; immunoglobulin; CH region; CL region; Kidney; Fc region; CH1 domain; CH2 domain; IgG; kappa protein; renal clearance rate; circulatory half-life. This invention describes a method for preparing a variant Fab or F(ab')2 polypeptide having increased half-life in vivo, where the polypeptide contains an Ig or Ig-like domain comprising a CH1 and/or CL region, is cleared from the kidneys and does not contain an IgG Fc region. The method involves altering the polypeptide within the CH1 or CL region to incorporate a salvage receptor binding epitope taken from two loops of a CH2 domain of an IgG Fc region. The polypeptides have a reduced renal Production of antibody fragments with reduced renal clearance - by introducing salvage receptor binding epitope into CH1 or CL region Disclosure; Column 55-58; 38pp; English. 95US-0422092. 95US-0422092. Snedecor BR; (GETH ) GENENTECH INC. WPI; 1999-152694/13 14-APR-1995; 14-APR-1995; 39-FEB-1999 Presta LG, 

The present sequence was used in a method for improving the in vivo half-life of polypeptides. The polypeptides comprise an Ig constant domain, and a salvage receptor binding expitope within the Ig or Ig-like domain. The salvage receptor binding taken from two loops of the CH2 domain. The salvage receptor epitope is taken from two loops of the CH2 domain of an Fc region of an Ig molecule. The modified polypeptides are useful for preventing or treating in IPA-1-mediated disorders, e.g. Crohu's disease, psoriasis, meningitis, allergic conditions (e.g. eczema), antigen-antibody complex mediated isseases. B-cell lymphomas. They are also useful for wound repair, reducing inflammatory responses and inducing tolerance to immunostimulants. They may also be used in diagnostic assays. The nucleic aidids and modified polypeptides are useful for the passive immunisation of patients, as well as for affinity purification of an antigen from recombinant cell culture or natural sources.

 It is employed in the prepn. of CD4 fusions. The insert site is given in the Features Table. CD4 fusion proteins can have antiviral and finanuomodilatory activity are esp. useful for treating HIV infections, regardless of genetic variation within the virus. They and antibodies raised against them can also be used diagnostically for assaying adhesons and their Ilgands.

 The invention relates to a compound which comprises a target cell-specific portion, comprising an humanised monoclonal antibody, having specificity for polymorphic epithelial mucin (PEM) or its antigen having transment and a cytotoxic portion having endonucleolytic activity, exemplified by AAM52154-AAM52168 and encoded by ABA02682-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.

 Prodn. of recombinant antibody (Ab), Ab fragment or Ab/enzyme fusion protein - by cytoplasmic expression in thio:redoxin:reductase deficient E. coli
 Gaps
 Production of recombinant antibodies (Ab), Ab fragments or Ab fragment/enzyme fusion proteins can be used for tumour therapy, especially when the fusion protein comprises a tumour-specific Ab fragment and an enzyme capable of converting a non-toxic product to a toxic drug. The fusion proteins are constructed in expression vectors and expressed in thioredoxinreductase deficient E.ooli, allowing expression products to be isolated in soluble functional form without renaturation. The Ab fragment is an FAb fragment or an antigen binding region. In the fusion protein, the Ab component is humanised and the enzyme component is a human cytoplasmic enzyme. This fusion protein comprises the antibody constant and variable

 High potency recombinant antibody, useful for preventing and treating diseases induced or caused by viruses, especially respiratory syncytial virus and parainfluenza virus, has high kinetic association rate
 The invention relates to a high potency antibody including its immunologically active portions, fragments and segments other than vitaxin. The antibody has increased potency, high rate constant for antibody-antigen complex formation and high affinity for any desired antigen. The high potency antibody is also useful for nullifying or ameliorating the effects of addictive drugs, such as cocaine. The high potency has specificity for antigenic determinants found on microbes such as viruses, bacteria or fungi, antigens found on ancore cells and toxic substances or product of toxic substances. The high potency antibody is useful for preventing or treating a disease caused by a virus such as respiratory syncytial virus (RSV) and parainfluenza virus (PIV). The present sequence is humanised high potency antibody full length light chain variable region.

ADDRESSEE: Genentech, Inc.
 Sequence 39, Application US/07934373C
Patent No. 5821337
GENERAL INFORMATION:
APPLICANT: Paul J. Carter
APPLICANT: Leonard G. Presta
TITLE OF INVENTION: Immunoglobulin Variants
NUMBER OF SEQUENCES: 48
CORRESPONDENCE ADDRESS:
 P0709P2
 REGISTRATION NUMBER: 40,378
REFERENCE/DOCKET NUMBER: POT
TELECOMMUNICATION INFORMATION:
 ADDRESSEE: Genentech, Inc.
STREET: 1 DNA Way
CITY: South San Francisco
STATE: California
COUNTRY: USA
 TELEFAX: 650/952-9881
INFORMATION FOR SEQ ID NO: 24:
SEQUENCE CHARACTERISTICS:
 STREET: 1 DNA Way
CITY: South San Francisco
STATE: California
 214 amino acids
Amino Acid
 1 DNA Way

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    receptor enables the production of recombinant cells expressing the receptor. Those cells can then be used to detect the presence of a modulator of zcytor10 protein by culturing the cells in the presence of a modulator of zcytor10 protein by culturing the cells in the presence of a test ligand and comparing levels of activity of mouse zcytor10 in the presence and absence of the test sample can be achieved. The method comprising contacting a test sample can be achieved. The method comprising contacting a test sample containing an amino cal sequence from Cys15 or Girs, of the zcytor 10 cytokine receptor and detecting the binding of the polypeptide to a ligand in the sample. Specified peptide fragments of the zcytor 10 cytokine receptor and the methods described are used to identify lagands that stimulate the proliferation and/or development of haematopoietic, lymphoid and myeloid cells. Peptide fragments of the cytokine receptor are useful for treating lymphoid, immune, inflammatory, splenic, blood or bone disorders and for generating antibodies directed against the receptor. A vector expressing a construct the extracellular cytokine binding domain of zottor 10 is fused to the heavy chain of IgG gamma and the extracellular construct the heavy chain of IgG gamma and the extracellular chain interleukin receptor subunit) is fused to human kappa light chain (See GBNESEQ record AAAS4475). The two sequences are fused to construct using two primers (AAAS4475).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVKFNWYVDGVEVHNAKTKPREEQYN 182

                                                                                                                                                                                                                                                                                                           The human CD4 cDNA is excised from the plasmid pSP6T4 and cloned into M13mp18. In order to excise a fragment containing the CH1 exon of the human gamma 1 heavy chain gene, the plasmid pBr gamma 1 is digested with SacII, and the SacII sites are then made flush using T4 DNA polymerase. The fragment containing the CH1 exon is then purified and ligated to the M13mp18 (CD4) vector. Oligonucleotide-mediated site-directed mutagenesis is then performed to juxtapose the CD4 and CH1 sequences in frame. The CD4-CH1 chimeric gene is then linearized and ligated to the Petl. Petl DNA fragment of the plasmid pBr gamma 1 containing the clessing CH2, and CH3 exons of the human gamma 1 chain gene designated CD4-IgGHKC-PRCCMV (ATCC 75192).

(I) has immunosuppressive, cytostatic, antirheumatic, artiarthritic, neuroprotective, antinflammatory, antirheumatic, approteins, (I) has immunosuppressive, cytostatic, antirheumatic, neptrotropic, dermatological, anti-HIV and hasmostatic activities, and can be used in vaccines. (I) or an antibody binding (I) can be used for suppressing the immune system for reducing rejection of leukaemias or lymphonas and grafts and for treating recil specific leukaemias or lymphonas and autoimmune diseases including rheumatorid arthritis, multiple sclerosis, diabetes mellitus, inflammatory bowel disease and sisease. The antibodies can also be used for treating immunologic renal diseases. Glomerulonephritis, mesangioproliferative disease, chronic lymphocytic leukaemia, secondary glomerulonephritis or vascuiltis associated with lupus, polyarteritis, scleroderma, HIV-related antibodies can also be used for treall or urological neoplasms and multiple myelomas, asthma, bronchitis, emphysema and other chronic

The invention relates to a method for treating or preventing a T cell mediated condition or, a Th2 cell mediated condition in a mammal. The method comprising a death domain containing receptor (DR6) agonist composition comprising a death domain containing receptor (DR6) agonist correction comprising a death domain condition in a mammal. A DR6 agonist is useful in the manufacture of a medicament for treating a T cell mediated condition in a mammal. A DR6 agonist is useful in the manufacture of a medicament for treating or preventing at least one symptom associated with abarrant apoptosis, graft-versus-host disease (GVHD), rheumatoid arthritis, eczemi, asthma, atopy, inflammatory bowel disease, vasculitis, psoriasis, pancretitis, inablandory stylendered mellitus, cancer, multiple selerosis, lashimoto's thyroiditis, Graves disease, transplant rejection, systemic unputs erythematosus, autoimmune daractosis, autoimmune gastritis, fibrosing lung disease, organ rejection after transplantation, thrombotic thrombocytopenic purpura (TYP), choonic alomentation, thrombotic thrombocytopenic purpura (TYP), adult respiratory distress syndrome (HNDS) adult respiratory distress syndrome (ANDS) crace condition or symptom related to the above mentioned diseases in a mammal. An DRS anteagonist is useful in the manufacture of a medicament for treating or preventing at laset one symptom associated with hypiciency syndrome (AIDS), fulminant viral hepatitis (HTV), HIV-induced lymphoma, HIV-induced acquired immunedeficiency associated uncertainned crace resource relating the pastitis of profession, crandoment viral hepatitis (ATV), HIV-induced lymphoma, HV-induced acquired immunedeficiency associated uncertainned repatiting of prience (AIDS), fulminant viral hepatitis (Brindicament relation or proposis, thuman immunodeficiency associated uncertainned according the partitis of prience (AIDS), fulminant viral hepatitis of prience (AIDS). Autoric distress syndrome (AIDS), fulminant viral hepatitis, derenciated ulceration or representation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     associated ulceration, cytoprotection during cancer treatment, recuperation from chemotherapy, recuperation from irradiation therapy, or a condition or symptom related to the above mentioned diseases in a mammal. The present sequence is human DR6 protein-related protein.
Treating or preventing T cell or Th2 cell mediated condition e.g., asthma or multiple sclerosis in mammal, comprises administering composition comprising death domain containing receptor, DR6 agonist
                                                                                                                                                                          Disclosure; Page 132-133; 133pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ecytor17 has immunomedilatory, antilifiammatory, antiviral, cytostatic, antirhemmatory antiviral, cytostatic, profilemmatic, antiathritic and muscular activities. The zcytor17 proteins are useful for treating and diagnosing lymphoid, immune, inflammatory, spheenic, blood or bone disorders. Agonists or antizorytor17 antibodies are useful in stimulating cell-mediated immunity and for stimulating lymphocyte proliferation, such as in the treatment of infections involving immunosuppression, including certain viral infections. They are also useful for inducting cytotoxicity and for treating leukopenias. Antagonist of zcytor17 polypeptides are useful for treating autoimmune diseases (e.g. crohn's disease), cancer, pancreatitis, and inflammatory bowel disease. Zcytor17 was mapped to chromosome 5, specifically to the Sqil chromosomal region. ABA933767 to ABA93343 and ABA93361 to ABA93346 in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVKFNWYVDGVEVHNAKTKPREEQYN 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an immunoadhesin comprising:

(a) a chimeric intercellular adhesion molecule (ICAM)-1 comprising a rhinovirus receptor protein linked to at least a portion of an immunoglobulin heavy chain, and

(b) optionally a J chain and secretory component associated with the chimeric ICAM-1 molecule. The immunoadhesin ls useful for chimeric ICAM-1 molecule. The immunoadhesin is useful for glycosylation and virucide activity. The immunoadhesin is useful for reducing infection by human rhinovirus (HRV) and hence the initiation or spread of the common cold by HRV. The immunoadhesin binds to HRV and compared to compare to the initiation or reduces its infectivity, competing with cell surface ICAM-1 for binding creduces its infectivity, competing with cell surface ICAM-1 for binding sites, interfering with virus entry or uncoating and directing premature release of viral RNA and formation of empty appsids. Expression of the immunoadhesin having multiple binding sites have a higher effective caffinity for the virus, thereby increasing the effectiveness of the immunoadhesin. Association of secretory component and immunoglobulin J chain coll culture and production in plants is safer for human use, constince plants are not known to harbor any animal viruses. The present the immunoglobulin protein sequence, useful to

The invention relates to a novel fusion protein comprising an IgB Feepsilon fragment and an IgG Fegamma fragment, which binds to an FeepsilonRI and/Or FeepsilonRI receptor and an FegammaRIB receptor. The fusion protein of the invention may have a see in protein therapy. The fusion protein is useful in tracting or preventing IgB-mediated allergies and asthma, such as allergic asthma, allergic rhinitis, hay fever, food allergy, atopic dermatitis and drug allergy. The allergic response is particularly caused by peanut allergen. The present sequence represents the human IgG1 Fegamma fragment.
                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   182

The present invention relates to a method of reducing the immunogenicity of a fusion protein. The method involves identifying a candidate T-cell epitope within a junction region spanning a fusion junction of a fusion protein and changing an amino acid within the junction region to reduce the ability of the candidate T-cell epitope to interact with a T-cell receptor. The method is useful for reducing the immunogenicity of fusion proteins for use in therapy. The present sequence is human immunoglobulin G1 (1gG1) heavy chain For region. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   122

The invention relates to a method for reducing the immunogenicity of a fusion protein which involves identifying a candidate T-cell epitope within a junction spanning a fusion junction of a fusion protein, and changing an amino acid within the junction region to reduce the ability of the candidate T-cell epitope to interact with a T-cell receptor. The method is useful for reducing the immunogenicity of a fusion protein. It is useful for analysing, changing or modifying one or more amino acids in the junction region of a fusion protein to identify a T-cell epitope and reduce its ability to interact with a T-cell receptor. The less immunogenic fusion proteins are useful in providing therapeutic treatment. The present sequence is human immunoglobuling therapeutic chain per cell need to illustrate the method of the invention.
                                                                                                        Reducing the immunogenicity of a fusion protein comprises changing a maino acid within the junction region to reduce the ability of the candidate T-cell epitope identified within the junction spanning to interact with T-cell receptor.

```
The sequences given in AAR43685-86 represent human immunoglobulin constant regions which were used in the production of the humanised resions which were used in the production of the humanised variable region coding sequences of the murine monoclonal antibody of pal.3, given in AAR43687-88. The CDRs from PBL.3 heavy and light chains were substituted for the CDRs of human heavy and light chains. CC The humanised variable regions were inserted into expression vectors. By coexpression of appropriate combinations of heavy and light chains, several humanised antibodies can be expressed. Coexpression of pHCWV-1748RHA-gammalCi-dhfr and pHCWV-1748RHA-RK-neo gives rise to the PBL.3/Humanised version A. Coexpression of pHCWV-1747CH-Gammacd-neo and pHCWV-1747-CL-KR-neo gives rise to the PBL.3/Humanised antibodies selectively bind epitopes on P-selectin and block adhesion of leukcyces to the vascular endothelium. They may be used to treat inflammatory and thrombotic diseases and other pathological coditions involving P-selectin and antibodies to it, esp. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             141

This sequence represents the preferred heavy chain. The humanised antibody of the invention may be used for diagnosing preclinical or clinical Alzheimer's disease. The antibody specifically binds an epitope, preferably the amyloid beta peptide (Abeta). The antibodies sequester Abeta from its bound, circulating form in blood and alter clearance of soluble and bound forms of Abeta in central nervous system and plasma. The antibodies specifically bind an epitope representing amino acids 13-28 of the Abeta molecule.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     62
                                                                                                                                                                                                                                                                                                                                          This sequence represents the preferred heavy chain from a deglycosylated version of the humanised mouse antibody 266 heavy chain of the invention. The antibody of the invention specifically binds an epitope, preferably the amyloid beta peptide (Abeta). The antibodies sequester Abera from its bound, circulating form in blood and alter clearance of soluble and bound forms of Abeta in central nervous system and plasma. The antibodies specifically bind an epitope representing amino acids 13-28 of the Abeta molecule. Deglycosylation of the heavy chain CDR2, as in this sequence, causes higher affinity for Abeta. The antibody of the invention may be used for diagnosing preclinical or clinical Alzheimer'

The invention relates to treating cognitive symptoms or reducing disease progression in a subject having a condition or disease associated with anyloid-beta peptide (Abeta). The method involves administering an amount of an anti-Abeta antichody that has greater affinity for soluble Abeta than 10^-.9 M, that has affinity (KD) for soluble Abeta 10 thigher than 10^-.9 M, or that has greater affinity for soluble Abeta than antichody 266 has. The method or the anti-Abeta antichody is useful in preparing a medicament for treating cognitive symptoms or reducing preparing a medicament for treating cognitive symptoms or disease associated with Abeta. The condition or disease is Alzheiner's diseases. Down's syndrome, cerebral amyloid angiopathy, vascular dementia, or mild cognitive impairment. The present sequence represents a humanised anti-Abeta antibody 266 heavy chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GLYSLSSUVTVPSSSLGTQTYICNVNHKPSNTKVDKKVEPKSCDKTHTCPPCPAPELLGG 122

The invention relates to treating cognitive symptoms or reducing disease any locabeta peptide (Abeta). The method involves administering an amount of an anti-Abeta peride (Abeta). The method involves administering an amount than 10^-9 M, that has affinity (KD) for soluble Abeta-40 or Abetal-42 higher than 10^-9 M, or that has greater affinity for soluble Abeta than antibody 266 has The method or the anti-Abeta antibody is useful in preparing a medicament for treating cognitive symptoms or reducing preparing a medicament for treating cognitive symptoms or reducing with Abeta. The condition or disease is Alzhaimer's disease, bown's syndrome, cerebral amyloid angiopathy, vascular dementia, or mild cognitive impairment. The present sequence represents a preferred heavy chain or a humanised anti-Abeta antibody 266 analogue that has a high

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
